

Abstract of the disclosure

To unlock and re-rock a dial lock for a traveling bag for inspection, a center lock 6 of the bag includes an ordinary dial lock 20 having dials 21, and an operation part 50 operated with a master key by only an inspector, a bolt of the dial lock has a pressing part, which is pressed by the master key inserted into a key hole 52 of a key hole plate 51 of the operation part 50 to make the dial lock in an unlocking state, the key hole plate 51 rotated together with the key is formed in an oval-like shape obtained by cutting off both sides of a disk so that a colored part 54 of a front plate 53 appears in the cut off part of the key hole plate when the key is rotated to the unlocking state, thereby preventing failure of re-locking.
